Bandit wargames

I have reached level5 in this game.
For level 0 a secure ssh connection was to made with the game sever. The commands used in this level is ssh.
In the next level the password was hidden inside a readme file located inside home directory. In this level cat command was used to open the file. When the file was opened it contained the password. Moving on the next level the password was located inside a file named . By opening the file password for the next level was received. In this level cat ./- command was used.
In the next level the password was located inside a folder name with "spaces in this filename" which was also received. Here the used command was cat "spaces in this filename".
In the next level the password was stored inside a file .hidden which was located inside inhere directory. This directory also contained some other files as well. The command used for this level is cat .hidden.
In the fifth level the password was located inside inhere directory but the exact file name was not mentioned. It was only mentioned that it is the only human readable file. When inhere directory was opened this directory contained a lot more files. So finding the exact matching was not able to be done.
